Optimization for Fully Connected Networks ¶

In this notebook, we will implement different optimization rules for gradient descent. We have provided starter code; however, you will need to copy and paste your code from your implementation of the modular fully connected nets in HW #3 to build upon this.

CS231n has built a solid API for building these modular frameworks and training them, and we will use their very well implemented framework as opposed to "reinventing the wheel." This includes using their Solver, various utility functions, and their layer structure. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils. As in prior assignments, we thank Serena Yeung & Justin Johnson for permission to use code written for the CS 231n class (cs231n.stanford.edu).

```
In [21]:
         ## Import and setups
         import time
         import numpy as np
         import matplotlib.pyplot as plt
         from nndl.fc net import *
         from cs231n.data utils import get CIFAR10 data
         from cs231n.gradient check import eval numerical gradient, eval numerical grad
         ient array
         from cs231n.solver import Solver
         %matplotlib inline
         plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
         plt.rcParams['image.interpolation'] = 'nearest'
         plt.rcParams['image.cmap'] = 'gray'
         # for auto-reloading external modules
         # see http://stackoverflow.com/questions/1907993/autoreload-of-modules-in-ipyt
         hon
         %load ext autoreload
         %autoreload 2
         def rel error(x, y):
              """ returns relative error """
             return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

The autoreload extension is already loaded. To reload it, use: %reload_ext autoreload

```
In [22]: # Load the (preprocessed) CIFAR10 data.

data = get_CIFAR10_data()
    for k in data.keys():
        print('{}: {} '.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
    y_train: (49000,)
    X_val: (1000, 3, 32, 32)
    y_val: (1000,)
    X_test: (1000, 3, 32, 32)
    y test: (1000,)
```

Building upon your HW #3 implementation

Copy and paste the following functions from your HW #3 implementation of a modular FC net:

- affine_forward in nndl/layers.py
- affine_backward in nndl/layers.py
- relu_forward in nndl/layers.py
- relu_backward in nndl/layers.py
- affine_relu_forward in nndl/layer_utils.py
- affine_relu_backward in nndl/layer_utils.py
- The FullyConnectedNet class in nndl/fc_net.py

Test all functions you copy and pasted

```
In [23]: from nndl.layer tests import *
         affine forward test(); print('\n')
         affine backward test(); print('\n')
         relu forward test(); print('\n')
         relu_backward_test(); print('\n')
         affine relu test(); print('\n')
         fc net test()
         If affine forward function is working, difference should be less than 1e-9:
         difference: 9.769849468192957e-10
         If affine backward is working, error should be less than 1e-9::

Training a larger model

In general, proceeding with vanilla stochastic gradient descent to optimize models may be fraught with problems and limitations, as discussed in class. Thus, we implement optimizers that improve on SGD.

SGD + momentum

In the following section, implement SGD with momentum. Read the nndl/optim.py API, which is provided by CS231n, and be sure you understand it. After, implement sgd_momentum in nndl/optim.py. Test your implementation of sgd momentum by running the cell below.

```
In [24]: | from nndl.optim import sgd_momentum
        N, D = 4, 5
        w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
        dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
        v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
        config = {'learning_rate': 1e-3, 'velocity': v}
        next_w, _ = sgd_momentum(w, dw, config=config)
        expected next w = np.asarray([
            [0.47454737, 0.54133684, 0.60812632, 0.67491579, 0.74170526],
            [ 0.80849474, 0.87528421, 0.94207368, 1.00886316, 1.07565263],
            [ 1.14244211, 1.20923158, 1.27602105, 1.34281053, 1.4096
                                                                       11)
        expected velocity = np.asarray([
                      0.55475789, 0.56891579, 0.58307368, 0.59723158],
            [ 0.5406,
            [ 0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
            [ 0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
            [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                                       11)
        print('next w error: {}'.format(rel error(next w, expected next w)))
        print('velocity error: {}'.format(rel error(expected velocity, config['velocit
        y'])))
```

next_w error: 8.882347033505819e-09 velocity error: 4.269287743278663e-09

SGD + Nesterov momentum

Implement sgd_nesterov_momentum in ndl/optim.py .

```
In [25]: from nndl.optim import sgd nesterov momentum
         N, D = 4, 5
         w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
         dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
         v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
         config = {'learning rate': 1e-3, 'velocity': v}
         next w, = sgd nesterov momentum(w, dw, config=config)
         expected next w = np.asarray([
             [0.08714, 0.15246105, 0.21778211, 0.28310316, 0.34842421],
             [0.41374526, 0.47906632, 0.54438737, 0.60970842, 0.67502947],
             [0.74035053, 0.80567158, 0.87099263, 0.93631368, 1.00163474],
             [1.06695579, 1.13227684, 1.19759789, 1.26291895, 1.32824]])
         expected_velocity = np.asarray([
             [ 0.5406,
                       0.55475789, 0.56891579, 0.58307368, 0.59723158],
             [ 0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
             [0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
             [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                                           11)
         print('next_w error: {}'.format(rel_error(next_w, expected_next_w)))
         print('velocity error: {}'.format(rel error(expected velocity, config['velocit
         y'])))
```

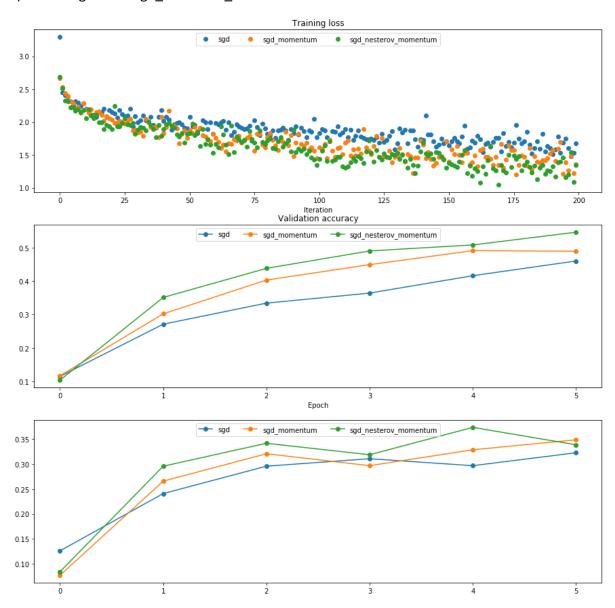

next_w error: 1.0875186845081027e-08 velocity error: 4.269287743278663e-09

Evaluating SGD, SGD+Momentum, and SGD+NesterovMomentum

Run the following cell to train a 6 layer FC net with SGD, SGD+momentum, and SGD+Nesterov momentum. You should see that SGD+momentum achieves a better loss than SGD, and that SGD+Nesterov momentum achieves a slightly better loss (and training accuracy) than SGD+momentum.

```
In [26]:
         num train = 4000
         small data = {
             'X_train': data['X_train'][:num_train],
              'y_train': data['y_train'][:num_train],
              'X_val': data['X_val'],
              'y_val': data['y_val'],
         }
         solvers = {}
         for update_rule in ['sgd', 'sgd_momentum', 'sgd_nesterov_momentum']:
             print('Optimizing with {}'.format(update_rule))
             model = FullyConnectedNet([100, 100, 100, 100], weight_scale=5e-2)
             solver = Solver(model, small data,
                              num_epochs=5, batch_size=100,
                              update rule=update rule,
                              optim config={
                                'learning_rate': 1e-2,
                              },
                              verbose=False)
             solvers[update_rule] = solver
             solver.train()
             print
         fig, axes = plt.subplots(3, 1)
         ax = axes[0]
         ax.set title('Training loss')
         ax.set xlabel('Iteration')
         ax = axes[1]
         ax.set title('Training accuracy')
         ax.set xlabel('Epoch')
         ax = axes[1]
         ax.set title('Validation accuracy')
         ax.set_xlabel('Epoch')
         for update rule, solver in solvers.items():
             ax = axes[0]
             ax.plot(solver.loss_history, 'o', label=update_rule)
             ax = axes[1]
             ax.plot(solver.train acc history, '-o', label=update rule)
             ax = axes[2]
             ax.plot(solver.val_acc_history, '-o', label=update_rule)
         for i in [1, 2, 3]:
             ax = axes[i - 1]
             ax.legend(loc='upper center', ncol=4)
         plt.gcf().set_size_inches(15, 15)
         plt.show()
```

Optimizing with sgd Optimizing with sgd_momentum Optimizing with sgd_nesterov_momentum

RMSProp

Now we go to techniques that adapt the gradient. Implement <code>rmsprop</code> in <code>nndl/optim.py</code> . Test your implementation by running the cell below.

```
In [27]: from nndl.optim import rmsprop
         N, D = 4, 5
         w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
         dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
         a = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
         config = {'learning rate': 1e-2, 'a': a}
         next_w, _ = rmsprop(w, dw, config=config)
         expected next w = np.asarray([
           [-0.39223849, -0.34037513, -0.28849239, -0.23659121, -0.18467247],
           [-0.132737, -0.08078555, -0.02881884, 0.02316247, 0.07515774],
           [ 0.12716641, 0.17918792, 0.23122175, 0.28326742, 0.33532447],
           [ 0.38739248, 0.43947102, 0.49155973, 0.54365823, 0.59576619]])
         expected_cache = np.asarray([
           0.5976,
                     0.6126277, 0.6277108, 0.64284931, 0.65804321],
           [ 0.67329252, 0.68859723, 0.70395734, 0.71937285, 0.73484377],
           [ 0.75037008, 0.7659518, 0.78158892, 0.79728144, 0.81302936],
           [ 0.82883269, 0.84469141, 0.86060554, 0.87657507, 0.8926
         print('next_w error: {}'.format(rel_error(expected_next_w, next_w)))
         print('cache error: {}'.format(rel error(expected cache, config['a'])))
```

next_w error: 9.502645229894295e-08 cache error: 2.6477955807156126e-09

Adaptive moments

Now, implement adam in nndl/optim.py . Test your implementation by running the cell below.

```
In [28]: # Test Adam implementation; you should see errors around 1e-7 or less
         from nndl.optim import adam
         N, D = 4, 5
         w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
         dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
         v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
         a = np.linspace(0.7, 0.5, num=N*D).reshape(N, D)
         config = {'learning_rate': 1e-2, 'v': v, 'a': a, 't': 5}
         next_w, _ = adam(w, dw, config=config)
         expected next w = np.asarray([
          [-0.40094747, -0.34836187, -0.29577703, -0.24319299, -0.19060977],
          [-0.1380274, -0.08544591, -0.03286534, 0.01971428, 0.0722929],
          [ 0.1248705, 0.17744702, 0.23002243, 0.28259667, 0.33516969],

         print('next w error: {}'.format(rel error(expected next w, next w)))
         print('a error: {}'.format(rel error(expected a, config['a'])))
         print('v error: {}'.format(rel_error(expected_v, config['v'])))
```

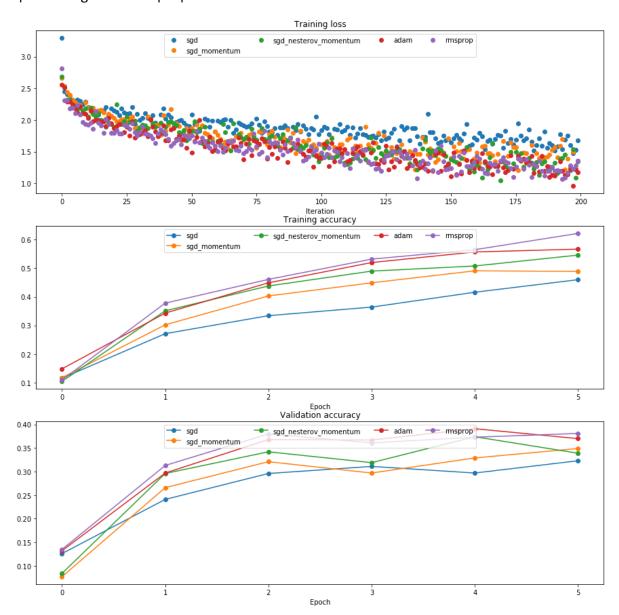

next_w error: 1.1395691798535431e-07 a error: 4.208314038113071e-09 v error: 4.214963193114416e-09

Comparing SGD, SGD+NesterovMomentum, RMSProp, and Adam

The following code will compare optimization with SGD, Momentum, Nesterov Momentum, RMSProp and Adam. In our code, we find that RMSProp, Adam, and SGD + Nesterov Momentum achieve approximately the same training error after a few training epochs.

```
In [29]: learning rates = {'rmsprop': 2e-4, 'adam': 1e-3}
         for update_rule in ['adam', 'rmsprop']:
             print('Optimizing with {}'.format(update rule))

```

Optimizing with adam
Optimizing with rmsprop

Easier optimization

In the following cell, we'll train a 4 layer neural network having 500 units in each hidden layer with the different optimizers, and find that it is far easier to get up to 50+% performance on CIFAR-10. After we implement batchnorm and dropout, we'll ask you to get 55+% on CIFAR-10.

```
In [30]:
         optimizer = 'adam'
